Tips for using this template:

1. Raw data goes to the "Data" sheet. "Timestamp" is the time data is posted, "Timepoint" is the time data is sent from the device.
2. Number format in the "Timepoint" column must be a decimal number for the chart to plot properly.
3. "Report" sheet formats data newest to oldest and allows unit conversion from Fahrenheit to Celsius and SG to Plato.
4. "Report" sheet also allows viewing multiple time frames for higher level detail.
5. Some cells have warnings on making changes, this is to prevent accidental edits that would make the sheet not work.
6. Comments on sheet help explain why some of the calculations are there. Comments may be deleted if desired.

[1] Used as final gravity (FG) in calculations.

[2] Used as original gravity (OG) in calculations.

[3] ABV Calculation Options

- Standard Method: $(OG - FG) \times 1.3125$

- Alternate Method: Based on Brewer's Friend alternate ABV formula (<https://www.brewersfriend.com/2011/06/16/alcohol-by-volume-calculator-updated/>)

- UK HMRC Method ABV: Based on UK's HM Revenue and Customs (<https://www.gov.uk/government/publications/excise-notice-226-beer-duty/excise-notice-226-beer-duty--2#calc-of-abv>)
